Assessment, Plan and Orders - January 22, 2026

Clinical Assessment

(1) Hypertension, Stage 1 - BP 138/88

Blood pressure remains elevated at 138/88 mmHg, consistent with Stage 1 Hypertension (130-139/80-89 range per ACC/AHA 2017 guidelines). Patient previously declined pharmacotherapy and requested a lifestyle modification trial. Counseled today on dietary sodium reduction to below 2,000 mg/day and 30 minutes of moderate-intensity walking at least 4 times per week. Will recheck blood pressure at follow-up. If BP exceeds 140/90 at next visit, will strongly recommend initiating Lisinopril 10mg daily. Return in 6 months.

(2) Obesity, Class I - BMI 33.7

Weight unchanged from last annual visit (235 lbs). BMI 33.7, consistent with Obese Class I. No significant weight gain or loss in the past 12 months. Counseled again on diet and activity. Patient acknowledged occupational challenges of OTR truck driving. Provided MyPlate handout. Referral to dietitian declined by patient at this time. Will monitor.

(3) Obstructive Sleep Apnea - Managed

Sleep apnea is under active management with CPAP therapy per Dr. Lisa Cho. Patient reports compliance is good and he feels more rested. Per Dr. Cho's January 14, 2026 note, AHI on therapy is 3.2 events/hour (excellent) and compliance is 93.3% over 90 days. No titration changes recommended. DOT medical card is current through January 28, 2027. No further workup needed from this practice at this time.

(4) Bilateral Knee Stiffness

Patient reports bilateral knee stiffness, particularly after prolonged driving. No acute swelling, locking, or significant pain at rest. ROM adequate on exam. Likely occupational osteoarthritis, early stage. Ibuprofen 400mg PRN approved. Advised to take with food. No imaging needed at this time. If symptoms worsen or limit function, will order X-rays and consider orthopedic referral.
