ORTHOPAEDIC CONSULTATION AND IMAGING REPORT

Patient	Ms. Jean Mullen, Female, 45 years
Patient ID	KOC-2019-3344
Referred by	Self / continuing care
Consultant	Dr. K. Connolly, MS Ortho, Consultant Orthopaedic Surgeon
Date of consultation	16 January 2026
Occupation	Professional dancer and dance teacher

History

Known case of chronic right lateral ankle instability following an inversion injury sustained during a performance in 2019. Periodic review. Reports the ankle is stable in daily activity but aches after extended hard-shoe rehearsal. No new acute injury. Increasing rehearsal load expected through the autumn ahead of a December production.

Examination

Mild tenderness over the anterior talofibular ligament. No effusion. Anterior drawer mildly positive, comparable to prior reviews, no progression. Single-leg balance fair. Range of motion full and symmetrical. Calf bulk preserved.

Imaging (weight-bearing X-ray, right ankle)

No fracture. Joint space maintained. No significant degenerative change. Minor old ligamentous laxity consistent with the documented 2019 injury. Findings stable compared with the previous study.

Impression and plan

Stable chronic lateral ligament laxity, well compensated. No surgical indication. Continue proprioceptive and peroneal strengthening with physiotherapy (Claire Nolan, PhysioActive). Tape for high-load hard-shoe sessions. Limit deep repeated landings until reviewed. Ice after provoking sessions. Review in three months or sooner if symptoms change. Cleared to continue performance preparation within these limits.

Dr. K. Connolly
Consultant Orthopaedic Surgeon, Reg. No. TNMC 41122
