888 Bestgate Road, Suite 200, Annapolis, MD 21401 - Phone 410-555-0700

After Visit Summary

Patient	Juan Carlos Hernandez
Date of birth	March 15, 1954
Date of visit	February 19, 2026
Visit type	Routine three month follow up
Medical record	CLS-44829
Provider	Thomas Whitaker, MD, Pulmonology

Reason for visit

Routine three month follow up for chronic obstructive pulmonary disease, Stage 2 moderate, first diagnosed in 2019. Mr. Hernandez reports stable breathing with shortness of breath on exertion, particularly on inclines, and occasional wheezing in cold or humid weather. He has had no recent exacerbations and no emergency visits since the last appointment. He continues to walk thirty to forty five minutes most mornings at a moderate pace and performs the prescribed core strengthening exercises at home.

He remains a former light smoker who quit in 1995 and uses no supplemental oxygen. He reports good adherence to his maintenance inhaler and reaches for the rescue inhaler only a few times each week, usually after yard work or a brisk walk in cold air.

Pulmonary function testing

Measure	Result	Predicted	Interpretation
FEV1	1.92 L	2.71 L	71 percent of predicted
FVC	3.28 L	3.74 L	88 percent of predicted
FEV1 over FVC	0.59	0.74	Consistent with moderate obstruction
Oxygen saturation at rest	96 percent		Within normal range

Assessment and plan

Lung function is stable compared with the August 2025 study. No supplemental oxygen is indicated at this time. Continue tiotropium bromide, one inhalation each morning, and keep the albuterol rescue inhaler on hand as needed. Continue daily walking and core strengthening. Repeat pulmonary function testing in six months.

Medication review

Medication	Dose and schedule	Purpose
Tiotropium bromide (Spiriva)	18 mcg, one inhalation each morning	COPD maintenance
Albuterol inhaler	90 mcg, as needed	Rescue for shortness of breath
Allopurinol	300 mg each evening	Gout, managed by rheumatology
Lisinopril	10 mg each morning	Mild hypertension
Aspirin	81 mg daily	Cardiac protection

Self care instructions

- Use the rescue inhaler if breathing tightens and rest until it eases. Note how often you reach for it.
- Avoid prolonged time outdoors when the air is very cold, very humid, or smoky.
- Keep walking, but choose flatter routes on harder breathing days. The seawall is a good option.
- Bring a current medication list to every visit and report any new cough, fever, or change in sputum.

Next appointment

December 17, 2026 at 9:00 AM, with pulmonary function testing beforehand. Please arrive fifteen minutes early and bring a current medication list. If breathing worsens before then, call the office and we will see you sooner.
