PULMONARY FUNCTION STUDY REPORT AND INITIAL DIAGNOSTIC ASSESSMENT

Patient	Date of Birth	Date of Study	Referring Physician
Megan E. Turner	June 6, 1952	September 12, 2019	Dr. Steven Alford, Primary Care

SPIROMETRY RESULTS

Measurement	Predicted	Pre-BD Actual	Pre-BD % Predicted	Post-BD Actual	Post-BD % Predicted
FVC (L)	2.84	2.61	92%	2.68	94%
FEV1 (L)	2.21	1.42	64%	1.48	67%
FEV1/FVC	0.78	0.54	--	0.55	--
FEF 25-75% (L/s)	2.40	0.98	41%	1.02	43%
PEF (L/s)	5.20	3.84	74%	3.91	75%

IMPRESSION

Spirometry demonstrates a moderate obstructive ventilatory defect with reduced FEV1/FVC ratio (0.54 pre-bronchodilator) and an FEV1 of 64% predicted. There is a modest response to bronchodilator (4% absolute improvement in FEV1), which does not meet criteria for significant reversibility. Findings are consistent with GOLD Stage II (Moderate) Chronic Obstructive Pulmonary Disease (COPD).

HISTORY / CONTRIBUTING FACTORS

Patient reports no personal tobacco use. History of decades of secondhand smoke exposure from husband's pipe tobacco and occupational exposure on the factory floor at Seth Thomas Clock Company, Thomaston, CT (1975-2003). Patient has been experiencing progressive exertional dyspnea and chronic cough for approximately 18 months.

DIAGNOSES

- 1. COPD, GOLD Stage II (Moderate), ICD-10 J44.1
- 2. Chronic cough secondary to COPD
- 3. Secondhand smoke exposure, long-term, contributing cause

PLAN

1. Initiate tiotropium bromide 18 mcg (Spiriva HandiHaler), one inhalation each morning. Instruct on proper inhaler technique.
2. Prescribe albuterol sulfate rescue inhaler for as-needed use. Instruct patient to contact this office if using rescue inhaler more than 2 days per week.
3. Refer to outpatient pulmonary rehabilitation for breathing exercise program.
4. Administer annual influenza vaccine and pneumococcal vaccine (PCV15) at next primary care visit.
5. Return to pulmonology in six months. Advise patient to notify office immediately if symptoms worsen.
