

Laboratory and Visit Summary

Patient	Jordan Brock
Date of birth	November 22, 1977
Visit date	January 14, 2026
Provider	Dr. Nadia Hassan, MD
Reason for visit	Annual preventive physical

History of Present Concerns

The patient presents for a routine annual physical and reports feeling well. He trains at high intensity five days a week and follows a Mediterranean style diet that is heavy on vegetables, fish, and whole grains. He notes occasional short periods of poor sleep during demanding work stretches, managed without daily medication. He has no chest pain, shortness of breath, or new symptoms to report.

Past Medical and Family History

No chronic conditions and no regular prescription medications. The patient takes vitamin D, magnesium, an omega 3 fish oil, and a probiotic. Family history is reviewed and is noncontributory for early cardiac events. Immunizations are up to date.

Vital Signs

Measure	Result	Reference
Blood pressure	118 / 74 mmHg	Below 120 / 80
Resting heart rate	54 bpm	60 to 100
Body mass index	23.4	18.5 to 24.9
Weight	181 lb	

Comprehensive Laboratory Panel

Test	Result	Reference	Flag
Total cholesterol	176 mg/dL	Under 200	Normal
LDL	98 mg/dL	Under 100	Normal
HDL	61 mg/dL	Above 40	Normal
Triglycerides	84 mg/dL	Under 150	Normal
Fasting glucose	88 mg/dL	70 to 99	Normal
Hemoglobin A1c	5.2 percent	Under 5.7	Normal
Vitamin D	44 ng/mL	30 to 80	Normal
TSH	1.9 mIU/L	0.4 to 4.0	Normal

Interpretation

All measured values fall within the normal reference range. The lipid panel is favorable, with an HDL above 60 and an LDL just under the target. Fasting glucose and the A1c indicate normal glucose handling. The resting heart rate in the low fifties is consistent with regular endurance and strength training. Vitamin D is comfortably in range on the current supplement.

Assessment

Excellent overall health. Cardiovascular markers are strong and consistent with regular high intensity training. There are no findings that require treatment or further workup at this time.

Plan

Continue the current supplement routine of vitamin D, magnesium, omega 3, and a probiotic. Maintain the current exercise pattern and Mediterranean style diet. For the occasional poor sleep during high stress periods, continue the wind down routine and short term melatonin only as needed. No medication changes are indicated.

Preventive Care and Follow Up

Item	Recommendation
Next preventive visit	Twelve months, January 2027
Bloodwork	Repeat lipid and metabolic panel at next visit
Blood pressure	Continue routine monitoring
Lifestyle	Maintain training, diet, and sleep habits

Review of Systems

A full review of systems was completed and is unremarkable. The patient denies chest pain, palpitations, shortness of breath, persistent cough, abdominal pain, joint pain, headaches, and changes in vision or hearing. Sleep is generally sound apart from short stretches during high stress periods at work. Mood and energy are good and appetite is normal.

System	Finding
Cardiovascular	No chest pain or palpitations
Respiratory	No shortness of breath or cough
Gastrointestinal	No pain, normal appetite
Musculoskeletal	No joint pain, trains without limitation
Neurological	No headaches or sensory changes
Sleep and mood	Good, occasional short term insomnia

Patient Instructions and Supplement Guidance

Continue the current supplement routine at the doses below. Take magnesium in the evening to support sleep. Keep vitamin D with a meal that contains fat for absorption. There is no need to add or change any prescription medication at this time. Return sooner than the scheduled interval if any new symptom develops.

Supplement	Guidance
Vitamin D 2000 IU	Once daily with a meal
Magnesium glycinate	Once nightly to support sleep
Omega 3 fish oil	Once daily with food
Probiotic	Once daily, any time
