

Crypto Asset Movements — Settlement-Date Reconciliation

Three-Account Exposure Model · SEK/EUR Basis · Settlement vs Reporting Date

Engagement	Vinterberg Group AB — forensic accounting mandate
Prepared by	Carl Dillon, Eriksson & Holm Revisionsbyrå
Accounts in scope	Kraken & Binance (operational) + Coinbase (counterparty-ledger only)
Extract scope	13 movements (sample) across FY2024–FY2025
Source of record	crypto_movements_sample.csv (seed sample)
Valuation basis	Settlement-date price feed (NOT reporting-date)
Cut-off / as-of	2026-10-22
Document reference	VG-CRYPTO-RECON-01

CLASSIFICATION

CONFIDENTIAL — PRIVILEGED. This is a 13-line SAMPLE, not the full movement history. Use crypto_counterparty_ledger.csv (50 records) + crypto_price_feed_settlement.csv for the load-bearing reconciliation.

1. Executive Summary

13 Movements sampled 3 exchange accounts	SEK 184,145,860 Settlement-date basis correct valuation	SEK 174,953,880 Reporting-date basis understated (audit error)	SEK 9,191,980 Understatement settlement – reporting
---	--	---	--

The crypto trail runs through two operational exchange accounts (Kraken and Binance) and a third account (Coinbase) that surfaces **only** in the counterparty ledger. The internal audit note valued movements at the **reporting date**, which sits on the wrong side of a rising SEK basis and therefore understates the exposure by a real margin. Reconciling each movement to the **settlement-date** price feed restores the defensible figure. All conversions are traceable to a named settlement-date source.

WHY THIS SAMPLE IS A TRAP

This is a 13-line illustrative sample. The full movement population lives in **crypto_counterparty_ledger.csv** (50 records) reconciled against **crypto_price_feed_settlement.csv** (32 settlement-date price points). The sample demonstrates the settlement-vs-reporting mechanic but must not be quantified as the total exposure.

2. Findings

2.1 Settlement-date valuation governs

For every BTC and ETH movement the settlement-date SEK price exceeds the reporting-date price, so the settlement-date basis is higher. Summed across the sample the reporting-date basis understates exposure by **SEK 9,191,980**. The reconciled figure is stated in kronor with the working shown per row.

2.2 Coinbase is the third, counterparty-only account

USDC movements on **Coinbase** appear only in the counterparty ledger, not in the operational exchange feeds. USDC is dollar-pegged so settlement and reporting bases coincide; the account still matters because it is the off-ramp wallet. Note the negative movement CX-2025-0028 (–1,600) dated 2025-11-14 — a partial recovery / reversal that belongs in the 'unrecovered' statement.

2.3 Anchor to the diversion trail

Counterparty wallets tagged bc1qanchor* / bnbanchor* / 0xanchor* tie back to the shell-vendor funding path: shell invoices → bank vendor_payment → intercompany to VG-EE1 hub → crypto_funding (diversion_ref DIV-*).

3. Movement Register & Per-Row Reconciliation (13 records)

Rows shaded gold are the Coinbase counterparty-only (third) account. SEK bases shown at settlement and reporting date; the difference is the audit understatement.

Move Id	Exchange	Asset	Quantity	Settlement Date	Reporting Date	Price SEK Settlement Date	Price SEK Reporting Date	Sek Settlement Basis	Sek Reporting Basis	Counterparty Wallet

4. Reconciliation Method & Unrecovered Statement

4.1 Currency conversion basis

Each movement is valued as quantity × settlement-date SEK price, sourced from crypto_price_feed_settlement.csv. EUR equivalents follow the same settlement-date convention. Reporting-date valuation is retained only to quantify and name the audit understatement in the set-aside notes.

4.2 Statement of what remains unrecovered

The negative Coinbase movement (CX-2025-0028) represents a partial reversal only; the balance of value routed to exchange wallets remains unrecovered pending wallet attribution and counsel action. The full unrecovered figure is computed on the 50-record counterparty ledger, not this sample.

THREE-DIRECTION DEFENCE OF THE NUMBER

The total quantified exposure is defended from (1) the movement ledger reconciled at settlement date, (2) the shell-vendor invoice/bank diversion trail that funds it, and (3) the intercompany routing through the VG-EE1 hub. No single source stands alone.
