## Chief Complaint

Annual sinusitis management review. Patient reports four sinus infections in 2025 (January, March, July, September). Current symptoms: baseline nasal congestion, mild post-nasal drip. No active infection at time of visit.

## Procedures Performed

Nasal endoscopy performed in office. Findings: bilateral mild mucosal edema in the middle meatus region; no visible polyps; deviated septum (mild, right-sided) noted but unchanged from prior exam; sinus ostia patent bilaterally.

## Assessment

1. Chronic sinusitis, bilateral - recurring. Patient has experienced four acute bacterial exacerbations in 2025, consistent with the pattern from 2024 (three infections). The frequency and impact on quality of life and work function remain clinically significant.
2. Deviated nasal septum, mild right-sided - no change.

## Plan

Continue current medical management: fluticasone propionate nasal spray 50 mcg per nostril once daily, and twice-daily saline nasal rinse during symptomatic periods. Cetirizine 10 mg daily during pollen season (June through August).

Balloon sinuplasty was discussed in detail. Given the patient's infection frequency over the past two years and the failure of medical management to reduce recurrence below three infections per year, I am recommending evaluation for balloon sinuplasty if 2026 infection

count exceeds three. Patient is aware of the procedure, recovery timeline, and expected outcomes.

**Next Appointment:** October 2026 (annual follow-up)

**Prescriptions:** Fluticasone propionate 50 mcg nasal spray - refill authorized x3
