Cardiology Follow-Up Visit Summary

Patient:	Tony Michael Nguyen Sr.
Date of Birth:	December 14, 1954
Visit Date:	January 14, 2026
Physician:	Dr. Felicia Adams, MD, FACC
Visit Type:	6-month cardiovascular follow-up
Next Scheduled Visit:	January 14, 2027

Cardiovascular Assessment

Measure	Today's Reading	Target	Trend
Systolic Blood Pressure	148 mmHg	Below 140 mmHg	Persistently elevated
Diastolic Blood Pressure	90 mmHg	Below 85 mmHg	Mildly elevated
Resting Heart Rate	66 bpm	60 to 80 bpm	Normal
LDL Cholesterol (from annual physical)	142 mg/dL	Below 100 mg/dL	Borderline high
Weight	183 lbs	Stable	Unchanged

Clinical Notes

Mr. Nguyen presents for his scheduled 6-month cardiovascular follow-up. He reports no chest pain, no palpitations, no shortness of breath at rest or with moderate exertion. He walks approximately 3 miles daily on the Sligo Creek Trail without cardiovascular symptoms. Sleep quality is reported as fair, with nocturia 1 to 2 times per night.

Blood pressure remains above target at 148/90. The reading has been consistent across multiple home readings logged by his Withings BPM Connect monitor. The current regimen of Lisinopril 20mg and Hydrochlorothiazide 12.5mg has been in place for several years and provides partial control.

LDL of 142 mg/dL from the February 2025 annual physical warrants dietary attention. No statin therapy is currently prescribed. Given the patient's diabetes and borderline LDL, the risk-benefit of adding low-dose statin therapy was discussed. Patient has declined at this time and prefers continued dietary modification.

Bilateral cataract surgeries in December 2025 and January 2026 were completed without reported cardiovascular complications.

Medication Review

Medication	Dose	Frequency	Status
Lisinopril	20 mg	Once daily (morning)	Continued, no change
Hydrochlorothiazide	12.5 mg	Once daily (morning)	Continued, no change

Plan

1. Continue Lisinopril 20mg and Hydrochlorothiazide 12.5mg unchanged.
2. Reduce dietary sodium intake to below 2,000 mg daily. Patient counseled and information sheet provided.
3. Continue daily walking regimen. Increase to 4 miles daily if knees permit.
4. Recheck LDL at the next annual physical in February 2026. If LDL exceeds 150 mg/dL at that visit, statin therapy will be revisited.
5. Next cardiology follow-up: January 14, 2027.
