

Shrimp Production Cycle 1 / 2026 - Harvest Summary

Bayshore Sustainable Aquaculture | Recirculating grow-out | Cycle window Nov 11, 2025 - Feb 22, 2026

Cycle 1 closed on schedule after a 103-day grow-out. This summary records stocking, feed, survival, and yield for the cycle so the four-cycle annual target stays on track. Figures are pulled from the daily feed sheet and the harvest weigh-out.

Cycle metrics

Post-larvae stocked	62,000 PL-12 (two nursery batches)
Stocking density	approx. 290 / m3 across six grow-out tanks
Grow-out days	103
Mean harvest weight	21.4 g (16-20 count, head-on)
Survival to harvest	78.6 percent
Total harvested	2,061 lb head-on
Feed conversion ratio	1.58 : 1
Mortality events	1 minor (Tank 4, low-DO scare Dec 30, corrected)

Disposition

Channel	Pounds	Avg price /lb	Gross
The Boathouse (standing order)	980	\$8.50	\$8,330
Other restaurant wholesale	560	\$8.25	\$4,620
Farmers' market (Strand)	410	\$11.00	\$4,510
Held / personal / samples	111	-	-

Lessons carried to Cycle 2

- FCR of 1.58 beat the 1.7 budget assumption. Holding the smaller mid-day ration during the cool window paid off.
- The Dec low-DO scare on Tank 4 traced to a fouled diffuser. Diffuser swap is now on the 60-day maintenance card.
- 16-20 count hit the size the restaurants pay best for. Target the same harvest weight next cycle rather than pushing for jumbo.

Cycle record. Survival and FCR feed the annual production plan (target four cycles, ~8,000 lb).
