

Bayshore Sustainable Aquaculture - Business Plan Summary

Internal planning document | Year 2 | Revision for 2026-2027

The operation

Bayshore raises Pacific white shrimp in a land-based recirculating system and Eastern oysters in a permitted rack-and-bag tidal lease on a two-acre Clear Lake Shores waterfront. The model pairs a controlled, year-round shrimp crop with a seasonal oyster crop to smooth cash flow and serve Gulf Coast restaurants that want local, traceable seafood.

Market

- Primary: Galveston-area restaurants buying fresh, local shrimp and oysters at a premium over imported product.
- Anchor account The Boathouse takes roughly 80 percent of oyster harvest; four other restaurants and the Saturday Strand market round out demand.
- Differentiator: same-day local delivery, named-farm provenance, and consistent grade.

Financial shape

2025 revenue	\$98,000
2026 revenue (projected)	\$145,000
2026 operating expense (projected)	approx. \$130,000
Grant support	Lonestar Foundation Small Business Innovation Grant - \$37,500 remaining
Break-even target	late 2026

Growth levers

- 1 Lift shrimp throughput toward the four-cycle, ~8,000 lb annual target without overstocking.
- 2 Expand permitted oyster rack area (TPWD application in progress) to meet restaurant demand.
- 3 Hold feed conversion near 1.6 and trim energy cost per pound with blower and chiller efficiency.
- 4 Keep the farmers' market channel for margin and direct customer relationships.

Principal risks

Cash flow during grow-out gaps, energy load, hurricane-season disruption, and permit timing. Mitigations: staggered cycles, grant-funded redundancy, a written storm protocol, and an early-start permit calendar.

Internal planning document. Not for external distribution without owner approval.
