

UTAH AVALANCHE CENTER
Salt Lake Area Forecast
Saved snapshot: February 15, 2026, 6:30 AM
Forecaster: Nikki Champion

BOTTOM LINE

Overall danger is MODERATE (Level 2 of 5) on upper-elevation north through east facing slopes, and LOW elsewhere. Human-triggered slides are possible on steep, wind-loaded terrain near and above treeline.

DANGER BY ELEVATION AND ASPECT

Above treeline: MODERATE on N, NE, E. LOW on other aspects.

Near treeline: MODERATE on NE, E. LOW elsewhere.

Below treeline: LOW.

AVALANCHE PROBLEMS

1. Wind Slab. Recent west winds built fresh slabs on leeward, upper-elevation slopes. These are the most likely to be triggered today. Look for stiff, drum-like snow and rounded pillows below ridgelines.
2. Persistent Weak Layer. A buried layer of faceted snow from early February remains a low-probability, high-consequence concern on shaded upper slopes.

TRAVEL ADVICE

Good day to ride lower-angle terrain and avoid steep, wind-loaded upper slopes. Mill D North and similar moderate skin tracks are reasonable with conservative terrain choices. Carry beacon, shovel, and probe, and travel one at a time on anything steep.

Weather: high near 30 F at 9,000 ft, light snow possible after noon.

This forecast was saved for planning a Big Cottonwood tour. Forecast valid for February 15, 2026 only; recheck before any future outing.
